## Signal processing guided by physiology: Making the most of cardiorespiratory signals Pablo Laguna ciber-bbn Universidad Zaragoza Centro Investigación Biomédica en Red Bioingeniería, Biomateriales y Nanomedicina

Santiago 2013. Master en Tecnologías de la Información y las Comunicaciones

## **Bioelectrical signals** convey info from biological systems: • Muscle Neuronal Heart

The Power of Life

**Bioelectricity of Living Tissue** 

Bioelectric signal
 contain relevant
 information about
 the underlying
 biological system

 Their decoding has allow to identify and clarify a large number of pathological conditions

#### Info within the biomedical signal

- May not be apparent in the signal
  - Measurement noise
  - Other interacting signals
  - Not visible to the human eye
- <u>Signal processing</u> usually required
  - Extract the useful info
  - Covert to meaningful and interpretable data
  - Not optimum to deep into the system/organ,
    - but, usually inexpensive and suitable for massive scrutiny making still wise to **go for the most**

## bioelectric signal origin

(a)

➡ Chemical gradient (b) Electrical gradient Extracellular K⁺<sub>CI⁻</sub> K⁺<sub>CI⁻</sub> K⁺<sub>Cl</sub> Membrane K⁺CI⁻ K⁺ K⁺CI⁻ K⁺Cl⁻ ĸ<sub>Cl</sub> K<sup>⁺</sup>CI 'K⁺<sub>Cl</sub>₋ K<sup>⁺</sup>Cl<sup>−</sup> K<sup>⁺</sup>Cľ K<sup>t</sup>CI Intracellular No channels opened Opening of  $K^*$  channels Equilibration

electrical impulse passing through the AV node, (d)-(g) ventricular depolarization, (h) ventricular repolarization, and (i) all cardiac cells again at rest.

Left atrium

His bundle

Left bundle

Left ventricle

Purkinje fibers

Septum

#### ECG Recording

## EGM signal origin

## ECG signal Characteristics

- •Pseudo periodic
- •Transitory
- •Non stationary

# Clinically relevant information Static

# Biomedical signal processing: Objectives

- Reduce the subjectivity of manual measures
- Noise Reduction
- Extract new information
- Equipment and new functionalities
- Signal modeling
- Event visualization

**Bioelectrical Signal Processing** Cardiac and Neurologisal Applicatio Leif Sörnmo & Pablo Laguna Elsevier/Academic Press, 2005 Libro de texto cuyo objetivo es unir la Ingenie -tratamiento de las señales bioeléctricas- con fisiologia

BIOELECTR SIGNAL PROCESSING CARDIAC AN NEUROLOGIC APPLICATIONS

Leif Sörnmo Pablo Laguna

# Biomedical signal processing difficulties

As opposite to other signal processing application:

- Biomedical signal originate at the inner human body
  →
  Their informative content is known just partially.
- The "truth" is rarely at our disposal to validate the tools.

## Reducing subjectivity at manual measures

### Waves of the ECG: P-QRS-T

Large differences, even, between manual marks form different cardiologist...

#### Waves delineation

#### Where is the real onset and end of waves? Multilead ECG delineation

step 1 D\_(k)

3000

E<sub>n</sub>(k)

#### Single lead

Group 1:Well detected<br/>end of T- waveme < 40 ms</th>SD < 50 ms</td>

#### Automatic annotations:

#### Manual annotations:

## Delineación de ECG: Validación

Bias (in ms) between automatic and manual anotations												
Detector	Pon	P	Poff	QRSon	QRSoff	Ton	T	Toff				
WT	1.3	-7.8	0.3	-6.6	-0.4	2.3	-6.1	0.7				
LPD	-9.4	-0.1	5.4	3.5	1.3	-3.3	-24.0	-19.7				

Mean Standard Deviation (in <i>ms</i> )												
Detector	Pon	P	Poff	QRSon	QRSoff	Ton	T	Toff				
WT	10.7	8.2	9.9	8.9	9.5	26.6	20.3	22.9				
LPD	11.2	9.3	12.7	9.5	9.3	24.7	25.6	26.9				
Tolerance	10.2	-	12.7	6.5	11.6	-	-	30.6				

Noise reduction

#### Noise

• External origin, as 50/60 Hz, other equipment, etc.

Physiological origin, as EMG in ECG analysis.

#### Basics with noise

- Every noise context should be address with a specific strategy, no generalization
  - Rarely one algorithm can be extrapolated without mayor considerations.
  - Their adaptation is very important NOT to destroy signal characteristics.

#### Ruido electrocardiográfico

### Filtering 50/60 Hz Solution: non-lineal filter •Substract a sinusoid

$$v(n) = w_0 \sin(\omega_0 n)$$

$$H(z) = \frac{V(z)}{U(z)} = \frac{1}{1 - 2\cos\omega_0 z^{-1} + z^{-2}}$$

•Error function

$$e(n) = x(n) - v(n)$$

$$e'(n) = e(n) - e(n-1)$$
  
=  $x(n) - x(n-1) - (v(n) - v(n-1))$ 

#### •Non-linear sinusoid update

$$\hat{v}(n) = v(n) + \alpha \operatorname{sgn}(e'(n))$$

Noise subtraction

$$y(n) = x(n) - \hat{v}(n)$$

## Warning: artifacts interpreted as late potentials.

#### Late potentials as arrhythmia risk markers in post MI patients

## Baseline variations at the ECG

#### **Baseline** filtering

#### Atrial fibrillation

### Atrial fibrillation: Multi-lead

#### Ionic modulation of Atrial Fibrillation dynamics

#### Regularity

Coupling

#### Atrial fibrillation: Where to Ablate? Guiding

#### Organization, synchronization and Coherence in EGM

### Ventricular arrhythmic risk indexes

### Time-invariant analysis of the QT / RR relationship

Hypothesis: QT is affected by a history of RR intervals that can be expressed as an RR weighted average ( $\overline{RR}$ )

### Time-invariant analysis of the QT / RR relationship

#### Repolarization Analysis and modelling

### Beat-to-beat response of QT to abrupt changes

### **Rate Adaptation of Repolarization**

#### 1. Ionic mechanisms of APD rate adaptation:

- > Fast phase: I<sub>CaL</sub> and I<sub>Ks</sub> dynamics in ventricle and maximal conductances of I<sub>CaL</sub> and I<sub>NaCa</sub> in atria
- Slow phase: intracellular Na<sup>+</sup> dynamics in both cavities

#### 2. Abnormally slow APD rate adaptation $\rightarrow$ higher arrhythmic risk

### **Repolarization variability and arrhythmic risk**

#### **Stochastic differential equation**

**Arrhythmic risk** 

### **Repolarization alternans**

### Detección de Alternancias

### Deteccion de alternancias

### Detección de alternnacias

$$x(i) = A + a(-1)^i + v(i), i = 1, ..., M$$

$$y(i) = x(i) - \bar{x}$$

Detector Gausiano

$$T_G = \left(\sum_{i=1}^M y(i)(-1)^i\right)^2$$

Repo a una

muestra dada

para latido i

Detector Laplaciano

$$T_L = \sum_{i=1}^{M} (|y(i)(-1)^i| - |y(i)(-1)^i - \hat{a}|)$$

#### Estimación de la alternancia

 $\hat{a} = \text{median}(y(1) \cdot (-1), y(2) \cdot 1, \dots, y(M) \cdot (-1)^M)$ 

### Tratamiento de señales biomédicas

#### Indices de riesgo cardiaco: <u>Alternancias</u>

### Alternancias de onda T en isquemia

# Does a multilead approach improve the clinical utility of TWA?

presence / absence of TWA TWA amplitude at each instant distribution of TWA among leads

#### **Evaluation of the PCA-based scheme**

PCA converts the input signal into a set of uncorrelated components sorted in descending order of variance

51

#### 3. Evaluation of the $\pi$ CA-based scheme

#### The component with 2-beat period is projected onto the first transformed lead

#### 3.2. Results: detection performance

### In synthetic signals, the multi- $\pi CA$ scheme presents the best $P_D$ for $V_{alt}$ between 20 and 105 dB

### Results: association of TWA indices and mortality risk

### The rate of deaths was significantly higher in TWA+ group for all end points

	Total Population	TWA-	TWA+	
	(n = 650)	(n = 493)	(n = 157)	p
Total mortality	146~(22.5%)	99~(20.1%)	47~(30.0%)	0.012
CD	119~(18.3%)	81~(16.4%)	38~(24.2%)	0.033
SCD	52~(8.0%)	30~(6.1%)	22~(14.0%)	0.003

CD

### Artefacted alternans from pedaling or stride cadence

RR

0

Dispersion of APD restitution from ECG

- APD restitution curves → APD vs RR (steady-state conditions)

### Dispersion of APD restitution from ECG

### Increased restitution dispersion associated to ventricular tachyarrhythmia

### Dispersion of APD restitution from ECG

### Agreement between simulated APDR slope dispersion and estimates from clinical ECG data

### **APPLICATION: Drug Cardiotoxicity**

#### Database

APDR dispersion ( $\Delta \alpha$ ) has been shown to provide better risk stratification after sotalol administration than standard ECG-biomarkers such as QTc.

## Depolarization Analysis. Ischemia monitoring and quantification

#### QRS slopes

- $\mathcal{I}_{\rm US}$  : up-slopes of the R wave
- $\mathcal{I}_{\rm DS}$  : down-slope of the R wave
- $\mathcal{I}_{TS}$  : terminal slopes of the S wave

### **Methods PCI**

### Quantification of the dynamic changes during ischemia

: absolute change during PCI

$$\mathcal{R}_{\mathcal{I}}(t_j) = \frac{\Delta_{\mathcal{I}}(t_j)}{\sigma^{\mathcal{I}}}$$

 $\sim$ : standard deviation (SD) of  $\mathcal{I}$  at control

### **Results in PCI**

QRS slopes measured in a control and PCI recording for a particular patient

CinC' 2010 Belfast

September 26-29th, 2010

### **Results PCI**

### Temporal analysis

Averaged relative factor of change for the QRS slopes in leads V2 and V3 during the occlusion.

Leads that presented the greatest changes.

### $\mathcal{R}_\mathcal{I}$

### **Results PCI**

### Comparison between standard and derived leads

Averaged relative factor of change for the lead V3 and those leads obtained from the spatial QRS loops.

### **Results PCI**

Multiple linear regression (also including R wave changes)

## Deriving Respiration from the Pulse PPG Signal

## Deriving Respiration from the PPG Signal

# Conclusions

- **Physiology-oriented** processing allows **better extracting the information** hidden in the biomedical signal
- Multimodal, Multiscale, Multidisciplinary signal processing may add in diagnosis, therapy and follow-up of diseases
- No general solutions, contextualization is always required
- Biosignal analysis, usually not optimum, but still suitable for massive scrutiny and monitoring so making sense go for the most
